Objects available in servlet

ServletConfig	this object is used to configure the individual servlet, using this object we may retrieve init-parameter values , by using functions config.getInitParameterNames() config.getInitParameter(name) There is one servletConfig object per servlet, so if 10 servlets are there, then we will have 10 ServletConfig object one for each servlet
ServletContext	This is a single object available for each Application If you want to pass any application level context parameter, then we may use ServletContext object
RequestDispatcher	It is used to transfer the control from one servlet to another servlet or servlet to jsp page, without users knowledge It is server side transfer from one component to another component within the application
